Overview

- Introduction Lattice Boltzmann Method
- Grid Convergence Study
- Reynolds Number Study
 - *Impact of Laminar/Turbulent Transition*
- General Flow Analysis
- Comparison Config 4 vs Config 5

Overview

Simulations

| Description | Low Reynolds | High Reynolds |
|----------------------------|--------------|---------------|
| Case 1 | - | 16° (c/m/f) |
| Case 2 a/b | 19° | - |
| Case 3 a/b | 0°-22° | 0°-23.5° |
| Case 3 a/b with Transition | 16°, 19° | 16°, 19° |

Lattice Boltzmann Method

Lattice Boltzmann Method

- Simulations performed with Lattice Boltzmann based solver PowerFLOW 5.0 beta
 - *D3Q19 LBM*
 - Cubic cells (Voxels)
 - Surface elements (Surfels)
 - *Fully transient*
 - *Turbulence Model: LBM-VLES*
 - Modified RNG k - ε model for unresolved scales
 - Swirl model
 - Extended wall model
 - *LTT Model*
 - Automatically determines transition locations

Lattice Boltzmann Method

Grid Scheme

- Cartesian Grid
- Voxel/Surfel concept with cut cells
→ no surface fitted grid required
- Automatic and robust grid generation process

Lattice Boltzmann Method

Case Setups

■ Grid Refinement Study

— *Refinement ratio 1.4*

| | Voxels [10 ⁶] | Resolution | | Refine Ratio | Number Total Voxels Ratio | Runtime per 0.1sec(*) |
|--------|------------------------------|------------|----------------------|-----------------|------------------------------|--------------------------|
| | | Space [mm] | Time [sec] | | | |
| Coarse | 90.3 | 0.23 | 6.0x10 ⁻⁷ | 1.4 | 2.26 | 0.6d |
| Medium | 214.6 | 0.16 | 4.2x10 ⁻⁷ | 1.4 | 2.37 | 1.6d |
| Fine | 545.7 | 0.11 | 3.0x10 ⁻⁷ | 1.4 | 2.54 | 4.2d |

(*) simulated physical time on 560 cores
Intel Sandybridge 2.7GHz

■ Reynolds Number Study

— *medium-equivalent grid used*

| Voxels | Resolution | | Runtime per 0.1sec(*) |
|-----------------------|------------|------------------------|--------------------------|
| | Space [mm] | Time [sec] | |
| 280 x 10 ⁶ | 0.14 | 3.9 x 10 ⁻⁷ | 1.9d |

Lattice Boltzmann Method

Example – Vorticity

Gird Convergence Study

Grid Convergence Study

Lift

- Asymptotic convergence not yet reached
- Trend lines (for $t > 0.25$ sec) indicate that for longer runtimes picture will change

Grid Convergence - Lift
Mach=0.175, Re=15.1 million, $\alpha=16^\circ$

Time History - Lift
Mach=0.175, Re=15.1 million, $\alpha=16^\circ$

Grid Convergence Study

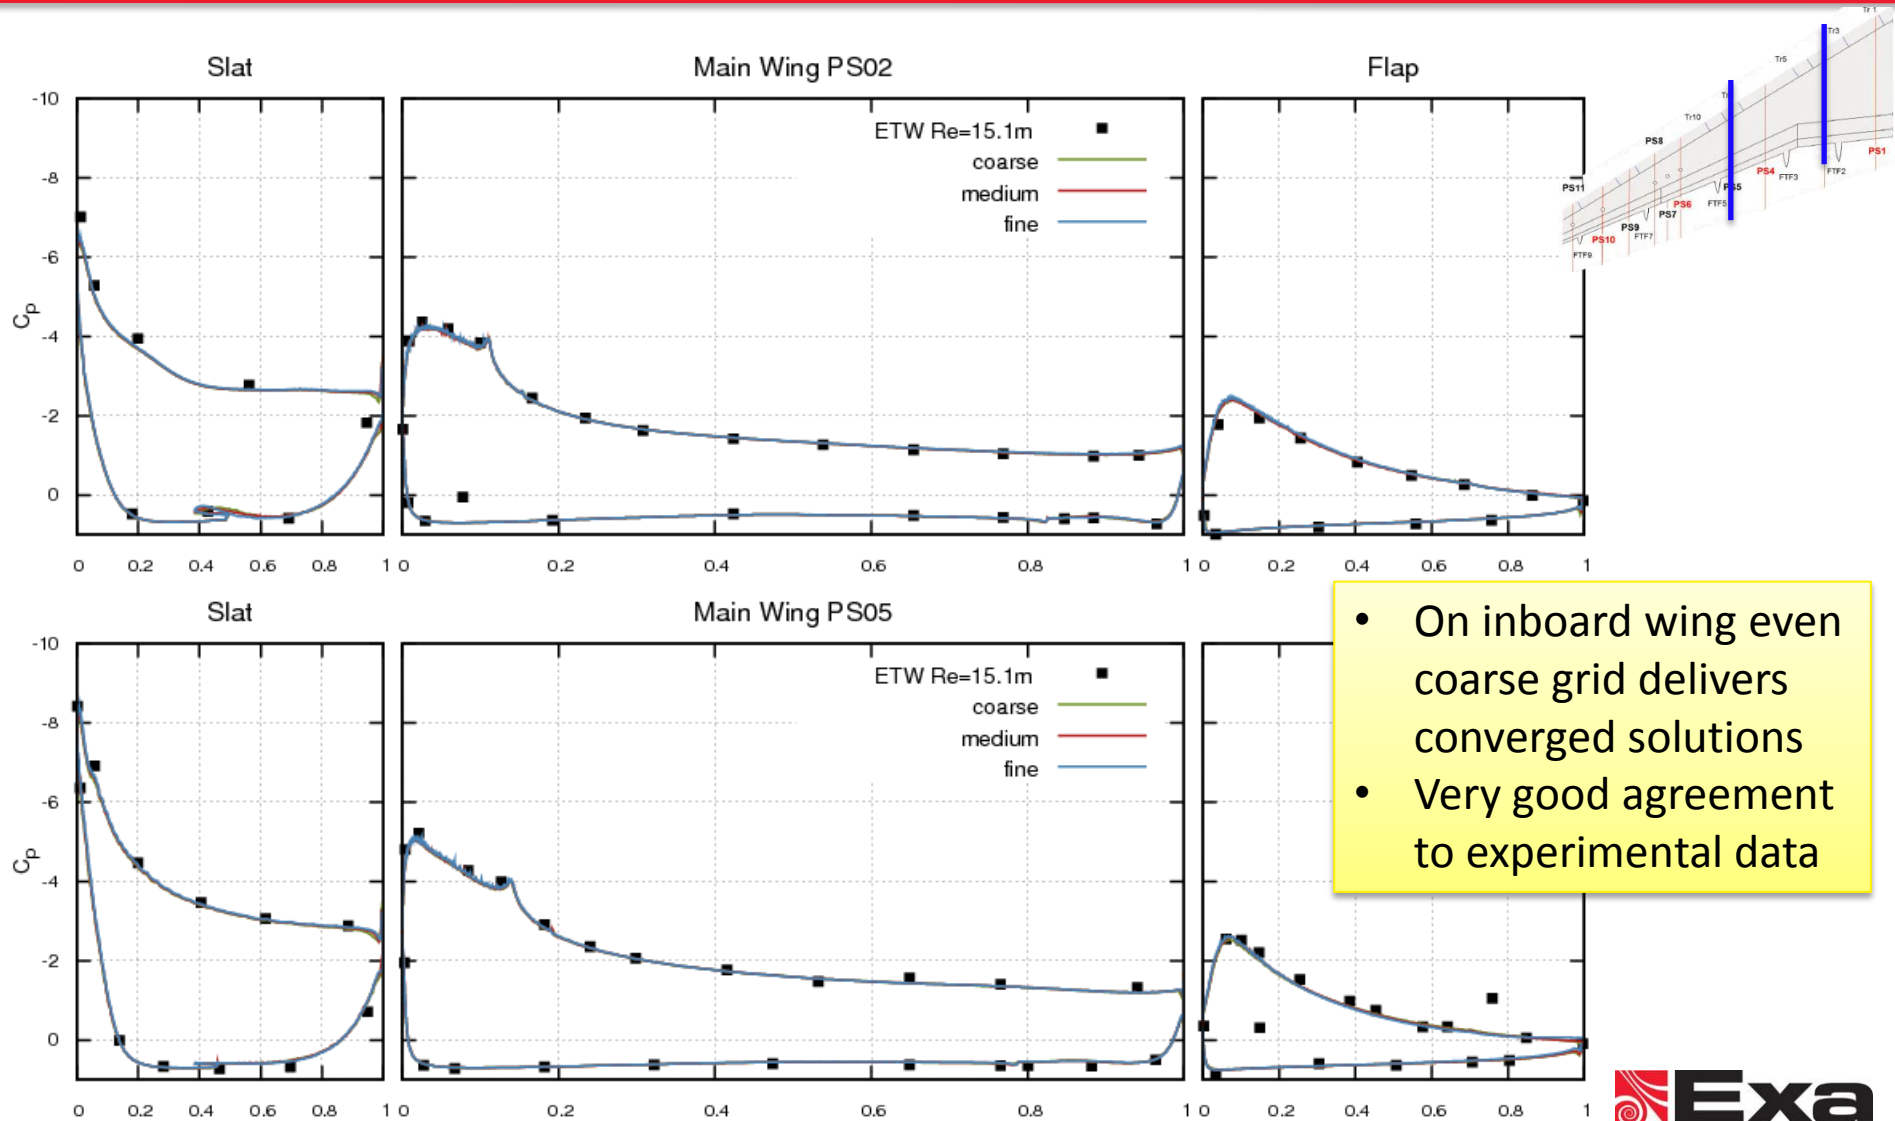

Drag and Pitching Moment

- Asymptotic convergence achieved for drag
- Pitching moment similar to lift, still showing slow trends

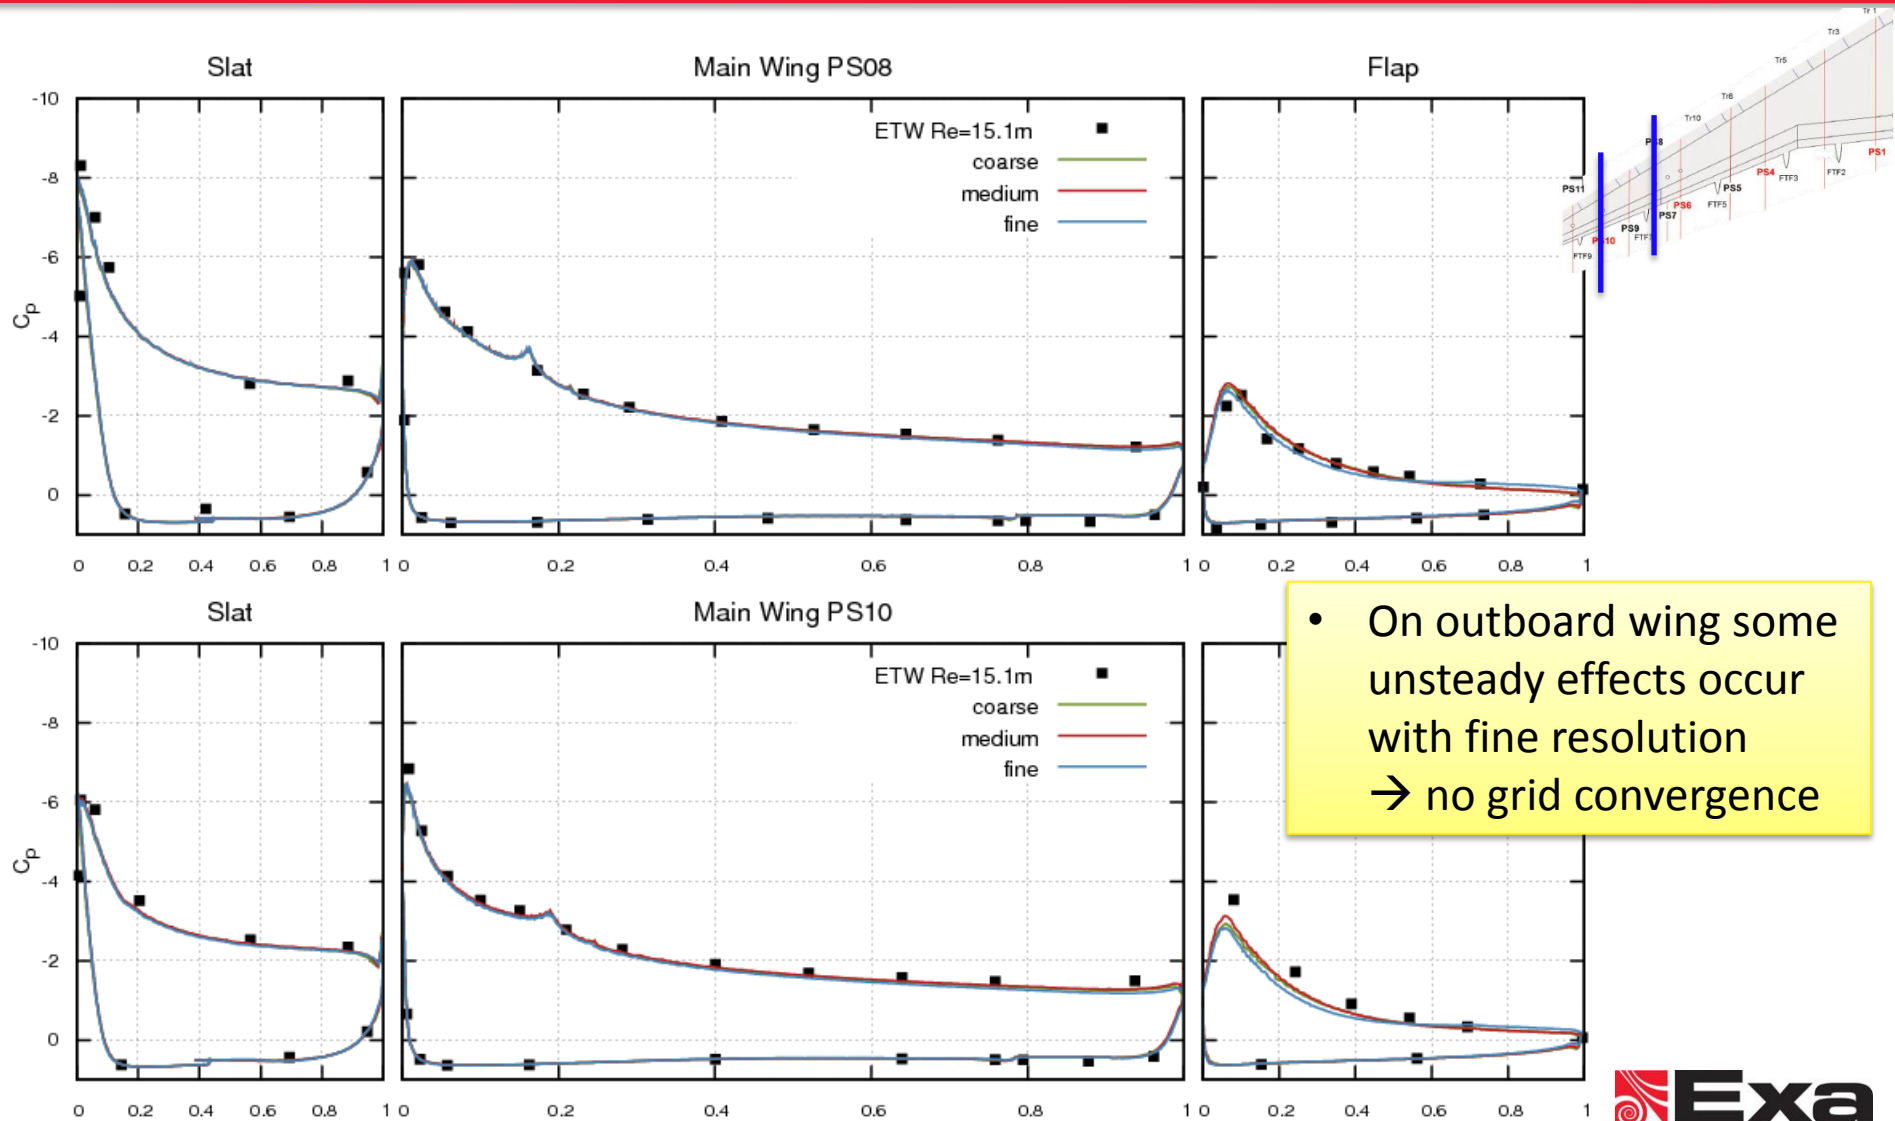

Grid Convergence Study

Cp-Distributions

Grid Convergence Study

Cp-Distributions

Grid Convergence Study

Unsteadiness at Higher Resolution

Bottom Surface

Top Surface

Surface pressure variation
 $C_p(t_2) - C_p(t_1)$ on fine grid

Significant unsteadiness
on fine grid

Reynolds Number Study Config 5

Results

Reynolds Number Study

Lift Polar

Lift x Alpha DLR-F11
Mach=0.175

- Reynolds trends captured well except for polar shape difference between low and high Reynolds numbers in WT

Δ Lift x Alpha DLR-F11
Mach=0.175

- CL under-predicted \rightarrow laminar/turbulent
- Lift slope under-predicted and variation not captured \rightarrow effect of half-model testing? (compare peniche effect)
- Delayed stall (due to under-predicted lift?)

Reynolds Number Study

Drag Polar

Lift x Drag DLR-F11
Mach=0.175

- Reynolds trend for drag well captured

Δ Drag x Lift DLR-F11
Mach=0.175

- Very good agreement at low C_L
- Over-predicting drag around C_{Lmax} (partly due to laminar/turbulent transition)

Reynolds Number Study

Pitching Moment Polar

Lift x Pitching Moment DLR-F11
Mach=0.175

- Very good agreement both absolute and for Reynolds trend

Δ Pitching Moment x Lift DLR-F11
Mach=0.175

Reynolds Number Study

Pressure Distributions

- Pressure distributions at $\alpha = 7^\circ, 16^\circ, 21^\circ$ are shown
- Inboard (PS02) and outboard (PS08) sections

Reynolds Number Study

Pressure Distributions – Alpha = 7deg

inboard

outboard

Reynolds Number Study

Pressure Distributions – Alpha = 16deg

inboard

outboard

Reynolds Number Study

Pressure Distributions – Alpha = 21deg

inboard

outboard

Reynolds Number Study with Laminar/Turbulent Transition

Results

Transition Study

Pressure Distributions – Alpha = 16deg

Lift x Alpha DLR-F11
Mach=0.175

Lift x Alpha DLR-F11
Mach=0.175

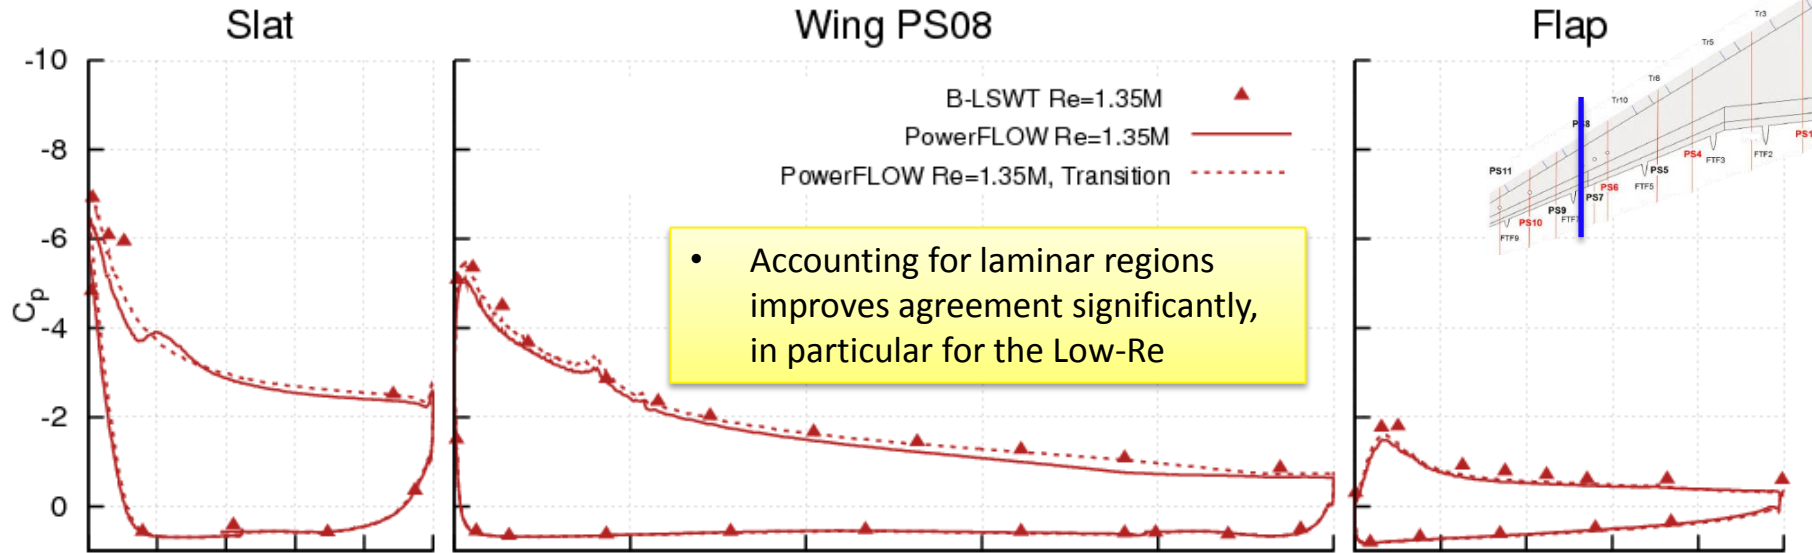

- Inclusion of laminar/turbulent transition significantly improves C_L levels, especially at low Reynolds number
- Work in progress

Transition Study

Pressure Distributions – Alpha = 16deg

Re = 1.35M

Re = 15.1M

Flow Analysis and Comparison to Experiment

Low Reynolds Number

Flow Visualization

Surface Flow – Alpha = 7deg

Flow Visualization

Surface Flow – Alpha = 7deg

PowerFLOW, fully turbulent

Flow Visualization

Surface Flow – Alpha = 18.5deg

Flow Visualization

Surface Flow – Alpha = 18.5deg

Alpha=18.5°, Re=1.35e6, 5.0-beta1, fully turb

PowerFLOW, fully turbulent

Flow Visualization

Surface Flow – Alpha = 18.5deg

PowerFLOW, Transition

Flow Visualization

Surface Flow – Alpha = 21deg

Flow Visualization

Surface Flow – Alpha = 21deg, fully turbulent

Alpha=21°, Re=1.35e6, 5.0-beta1, fully turb

PowerFLOW, fully turbulent

Velocity Profiles

Inboard Wing

X-Velocity Profiles - Plane 1, Window B, Line 1

X-Velocity Profiles - Plane 1, Window C, Line 1

Velocity Profiles

Outboard Wing – Flap

X-Velocity Profiles - Plane 2, Window E, Line 1

X-Velocity Profiles - Plane 3, Window E, Line 2

Comparison Config 4 vs Config 5

Results

Comparison Config 4 vs Config 5

Overview – $Re = 1.35m$

Lift x Alpha DLR-F11
Mach=0.175

Lift x Drag DLR-F11
Mach=0.175

- Differences between Config 4 and 5 are smaller than overall differences to experiment
→ Should still be a valid comparison

Comparison Config 4 vs Config 5

Surface Stream Lines – Alpha = 19deg

Config 4

Config 5

Config 4, Re=1.35m, Alpha=19deg

Config 5, Re=1.35m, Alpha=19deg

The flow separation driving the wing stall is missing on Config 4
→ Pressure tube bundles are crucial to predict stall correctly

Comparison Config 4 vs Config 5

Total Pressure in the Stall Region – Alpha = 19deg

Config 4

Config 5

Comparison Config 4 vs Config 5

X-Vorticity in the Stall Region – Alpha = 19deg

Config 4

Config 5

Conclusions

■ General

- *Good agreement with experimental pressure distributions*
- *Significant dependency on laminar/turbulent transition*
- *Stall mechanism well predicted but separation too small*
→ *stall delayed*

■ Resolution Study

- *Reasonable grid convergence achieved for $AoA=16deg$*
 - impacted by unsteady flow

■ Reynolds Study

- *Reynolds Trends captured well*

Next Steps

- Run Grid Sensitivity Study at $AoA=7deg$
- Investigate dependency of stall on
 - *Laminar/turbulent transition*
- Investigate WT effects
 - *WT walls*
 - *Peniche*
- Optimize grids
 - *for low and high Reynolds numbers separately*

Acknowledgement

We are grateful for support in conduction the simulations from

- McGill University, Montreal, Canada
- Purdue University, West Lafayette, IN

Thank You!

Additional Slides

Consideration on Measured Polar Shape

Figure 15: Measured lift curves for three different peniche heights

- Overall the peniche height has an influence, which can potentially not be fully corrected for
- Especially at lower Reynolds Numbers the polar shape can change due to the peniche
